

Quaternary Combinatorial Thin Films

By Chevrier, Vincent L.

Condition: New. Publisher/Verlag: VDM Verlag Dr. Müller | Production, Characterization and Visualization | Combinatorial materials science strives to accelerate materials discovery by producing and characterizing several compositions at once or in a high-throughput fashion. Thin films are ideal for combinatorial studies and several sputtering techniques exist for the production of binary (2 components) or ternary (3 components) films. Many new materials require more components and there is a growing need for combinatorial techniques allowing the exploration of quaternary materials (4 components). This book discusses the advantages and disadvantages of discrete versus continuous combinatorial sputtering techniques for quaternaries and presents a method for sputtering combinatorial quaternary thin films along with experimental results. The visualization of data from quaternary thin films is also discussed and visualization software is presented. This book proposes solutions to the challenges faced when considering quaternaries and should be useful to materials science researchers using thin film combinatorial methods. | Format: Paperback | Language/Sprache: english | 122 gr | 80 pp.
